Here, Dendrites receives signals from other neurons, the cell body, which processes those signals and the axon, a long cable that reaches out and interacts with other neuron's dendrites. When different parts of the brain communicate and coordinate with each other, they send nerve impulses, which are electrical charges that travel down the axon of a neuron, eventually reaching the next neuron in the chain.

process

Data Format

Immediate
Challenges

Results

- The brain contains more than 100 billion neurons that communicate with each other via axons for the formation of complex neural networks.
- In Brain, two kinds of tissue are there:
 - Grey matter,
 - White matter.

Immediate
Challenges

Results

- Grey matter, which has a pinkish-grey color in the living brain, contains the cell bodies, dendrites and axon terminals of neurons, so it is where all synapses are.
- White matter is made of axons connecting different parts of grey matter to each other.

Problem Statement

Given the tractography data of a human brain, Segment it automatically into tracts having **"similar"** fibers which are anatomically meaningful.

Goal

Make a software, which will take tractography data of brain as input and gives "similar" fiber 3D model of brain and some useful information according to given application(like, for brain tumor operation, it will give us shortest path for cutting fibers to remove tumor.)

Data Format

Immediate Challenges

Results

- It is important when a tissue, such as the neural axons of white matter in the brain has an internal anisotropy fibrous structure.
- Water will then diffuse more rapidly in the direction aligned with the internal structure, and more slowly as it moves perpendicular to the preferred direction.
- Tensors are used to model diffusion. Major eigen vectors of the tensor(Principle Directions) gives the fiber tract direction.

wikipedia.org

In neuroscience, tractography is a 3D modeling technique used to visually represent neural tracts using data collected by diffusion tensor imaging (DTI).

- Streamline Tractography estimates white matter tract trajectories following the most likely tract direction. It locally chooses the most likely fiber trajectory.
- **DTI with Tractography gives us the white matter fiber orientation.**

Preferred diffusion directions are shown as the long axes of diffusion ellipsoids. Here, red denotes left-right, green denotes back-front and blue up-down direction (out of the image plane). The white line shows the streamline obtained by connecting up a set of pixels based on their preferred directions and is an example of tractography.

Challenges

Results

Initially, we have 3 brain's data as .trk file format.

- brain's data (classified) which is ground truth model for us.
- brain's data (Non-classified) which can be used for testing.

Introduction

Problem Statement

Motivation

Background

Brain Data

Data collection
process

Data Format

Immediate Challenges

Results

The data is given in a file with .trk extension. Track(.trk) file is one single binary file, with the first 1000 bytes as the header and rest as the body. Some fields of header of track file are-

Name	Data-type	Bytes
id_string[6]	<i>char</i>	6
dim[3]	<i>short int</i>	6
voxel_size[3]	<i>float</i>	12
n_count	<i>int</i>	4
version	<i>int</i>	4
hdr_size	<i>int</i>	4

And the body part of the file contains "*n_count*" numbers of fibers as struct type and each struct of fiber contains

1.num_points: number of points in that fiber, **2. 2D array** of $\text{num_point} * 3$, where each row displays x, y, z coordinates of points of that fiber.

Here, we are using some name for particular things, which are mentioned below:

- Ground truth data - Brain1 data (classified)
- Class 0 - Grey Matter of Brain
- Classes of white matter fiber tracts:

Class no.	Class Name
Class1	Arcuate
Class2	Cingulum
Class3	Corticospinal
Class4	Forceps Major
Class5	Fornix
Class6	Inferior Occipitofrontal Fasciculus
Class7	Superior Longitudinal Fasciculus
Class8	Uncinate

Immediate
Challenges

Results

By observing ground truth data and fiber tracts' characteristics, we will develop some feature vector by which we can classify all the classes of white matter with good accuracy. After extracting features for classes, we will analyse this model using different classification algorithm and give the result as the best classification algorithm.

- Here, by observations we can say that above 105, we have only two classes eg. class-4 and class-6. So we can consider that point to classify this two class from rest of data.
- Also we are observing starting and ending points of classes as well as curvature points of classes for classification.
